The amount of bending that a light ray experiences can be expressed in terms of the angle of refraction (more accurately, by the difference between the angle of refraction and the angle of incidence). A ray of light may approach the boundary at an angle of incidence of 45-d and bend towards the normal. If the medium into which it enters causes a small amount of refraction, then the angle ...

An angle bisector divides an angle into 2 equal parts. The easiest way to construct a bisector of a given angle is with a protractor. First, measure the angle by placing the origin hole of the protractor on the angle's vertex and lining up the baseline with one of the angle's rays. Take the angle you get and divide this number by 2. For example, if the angle is 160 degrees, you would ...
