Linear regression analysis is the most widely used of all

statistical techniques: it is the study of linear, additive relationships

between variables. Let Y denote the “dependent” variable whose values

you wish to predict, and let X_1, \dots, X_k denote the “independent” variables

from which you wish to

predict.

Methods: The

Duxbury Series In

Statistics And

Decision Sciences

Regression analysis, in statistical modeling, is a way of mathematically sorting out a series of variables. We use it to determine which variables have an impact and how they relate to one another. In other words, regression analysis helps us determine which factors matter most and which we can ignore. It also helps us determine which factors interact with each other.
