Linear programming (LP, also called linear optimization) is a method to achieve the best outcome (such as maximum profit or lowest cost) in a mathematical model whose requirements are represented by linear relationships. Linear programming is a special case of mathematical programming (also known as mathematical optimization).. More formally, linear programming is a technique for the ...

The dual of a given linear program (LP) is another LP that is derived from the original (the primal) LP in the following schematic way: . Each variable in the primal LP becomes a constraint in the dual LP; Each constraint in the primal LP becomes a variable in the dual LP; The objective direction is inverted - maximum in the primal becomes minimum in the dual and vice versa.

Then, it is no longer linear in variables (because of the squared term) but it is still linear in parameters. And for (multiple) linear regression, that's all that matters because in the end, you are trying to find a set of β 's that minimizes a loss function. For that, you need to solve a system of linear equations. Given its nice ...
