From Neurobiology to Symptomatology. In summary, we now know that childhood abuse is linked with excess neuronal irritability, EEG abnormalities, and symptoms suggestive of temporal lobe epilepsy. It is also associated with diminished development of the left cortex and left hippocampus, reduced size of the corpus callosum, and attenuated activity in the cerebellar vermis. We see a close fit ...

Emotional response requires interest, seeking and learning. Panksepp's "SEEKING" requires curiosity, persistent interest and an expectation of a reward (Pleasure/Play). Seeking novelty turns on motivation centers with a pleasure or reward as end goal. Procrastination is a result of too much thinking instead of play/pleasure. Even compassion, the concern we feel for another being's welfare, has been treated with downright derision. Kant saw it as a weak and misguided sentiment: "Such benevolence is called soft-heartedness and should not occur at all among human beings," he said of compassion. Many question whether true compassion exists at all—or whether it is inherently motivated by self-interest.
